

OPEN SOURCE TECHNOLOGY THAT WORKS TODAY

Build a company on it.

This is working technology, not a pitch. Every row has an MVP or a live example I can show you at the stand — further along than most startups begin. It is all open source: take a row and run with it. You do not need me to.

THE USE CASE / POWERED BY		WHAT EXISTS
02	Share files the host cannot read, with history and a write-only upload link. Powered by sgit, transfer protocol & browser vault · permissive code; CC BY documents	Live. CLI in beta; 26 public vaults; 80+ endpoints and 3,000+ tests. Write-only intake built, never sold.
03	Manage and distribute sensitive data — healthcare data is the worked example. Powered by Vaults on the same runtime · permissive code; CC BY documents	An MVP is built on it.
04	Deliver a security report as a vault: evidence for every finding, retest scripts and views per audience. Powered by Report vault on the vault runtime · permissive code; CC BY documents	Designed 26 May. Deliverable shape built; demo specified.
05	Explain a specialist domain to a board or executive in their own words and at their own altitude — cybersecurity is one example. Powered by Boardroom, agent rooms & persona machinery · permissive code; CC BY documents	Original product existed. Agent rooms specified in March; persona generator built in August.
06	Briefings for your role, with the evidence behind every line. Powered by Role-aware briefings on semantic graphs · permissive code; CC BY documents	Live; named as the evidence research seed's live instance. Commercial state not verified in the brief.
07	Know what your agents can actually do and give each one a licence to operate. Powered by Risk product & free behaviour-policy library · permissive code; CC BY documents	Site v1.10, library and store live. No payment link; entry-tier application not located.
01	Turn voice into a debrief — wherever the voice already is: WhatsApp, a file, an agent. Powered by Voice Debrief + WhatsApp, file & agent integrations · permissive code; CC BY documents	Live, earning, and run with a partner under a signed profit share.

Seven further companies are written up in full and given away under attribution licensing. newsroom.sgit.ai/mvps/seed-companies.html

TWO WAYS TO BUILD A COMPANY ON IT

On your own. Instead of join and work on my thing, build your thing on top of what we have built. The code is permissive and the documents are CC BY.

With me — on one of three rungs:

One · Direct hire. Cash per mini project. Lowest commitment, both ways.

Two · Revenue share. Time boxed, no entity. Voice Debrief runs this way: 90 days; a quarter on net receipts; an even split of what remains. Either party may continue or fork on exit.

Three · A company. Shares and equity. Highest commitment, both ways.

Everything is open, so there is almost nothing to protect: the agreement collapses to the split, the term and a short list of sensitive items.

Pick a row. Let's talk about building a company on it.

Talk to me at the stand, or write to dinis.cruz@owasp.org
